Summary

Posted: **May 29, 2019**
Weekly Hours: **40**
Role Number: **200039719**

The Knowledge Graph team is looking for outstanding engineers to build the next- generation of knowledge graph and data infrastructure at Apple to power features including Siri and Spotlight. If you are interested in building a world-class

Key Qualifications

- Extensive systems programming experience in either Python or Java. Solid system development skills in UNIX-type OS (e.g. Linux, Mac OS)
- Experience working with large data sets and pipelines, ideally using the Apache
- software stack (e.g. Spark, HBase)
- Excellent problem-solving and analytic skills
- You are self-motivated and able to quickly learn new domains
- You have good attention to detail
- Broad knowledge of computer science and systems
- Excellent communication and collaborative skills; Able to work as part of a small, focused team and give your best effort

Description

The Siri Knowledge Graph team is building groundbreaking technology in the areas of question answering, knowledge base construction and machine learning. We aim to be a "know-it-all" question answering system, capable of answering questions from hundreds of millions of users about nearly anything. The question answering system is backed by a knowledge graph that was automatically constructed from a vast number of data sources including natural language text, HTML tables, and many others. You will have exciting opportunities to working on rapidly building a more complete and accurate knowledge graph with impact across all of Apple. This knowledge graph also enables many other features across Apple besides the question answering feature at Siri.
The problems we pursue include

* Information Extraction from natural language text and semi-structured data such as HTML tables
* Data Integration (e.g., Entity Resolution and Knowledge Fusion)
* Knowledge graph reasoning and inference
* Named Entity Linking

RAC1

From Wikipedia, the free encyclopedia

"Rac1" redirects here. For the first game in the Ratchet & Clank series, see Ratchet & Clank.

Rac1, also known as **Ras-related C3 botulinum toxin substrate 1**, is a protein found in human cells. It is encoded by the *RAC1* gene.[5][6] This gene can produce a variety of alternatively spliced versions of the Rac1 protein, which appear to carry out different functions.[7]

Contents [hide]

1 Function
2 Role in cancer

8 External links

Function [edit]

Rac1 is a small (~21 kDa) signaling G protein (more specifically a GTPase), and is a member of the Rac subfamily of the family Rho family of GTPases. Members of this superfamily appear to regulate a diverse array of cellular events, including the control of GLUT4[8][9] translocation to glucose uptake, cell growth, cytoskeletal reorganization, antimicrobial cytotoxicity,[10] and the activation of protein kinases.[11]

Rac1 is a pleiotropic regulator of many cellular processes, including the cell cycle, cell-cell adhesion, motility (through the actin network), and of epithelial differentiation (proposed to be necessary for maintaining epidermal stem cells).

Role in cancer [edit]

Along with other subfamily of Rac and Rho proteins, they exert an important regulatory role specifically in cell motility and cell growth. Rac1 has ubiquitous tissue expression, and drives cell motility by formation of lamellipodia.[12] In order for cancer cells to grow and invade local and distant tissues, deregulation of cell motility is one of the hallmark events in cancer cell invasion and metastasis.[13] Overexpression of a constitutively active Rac1 V12 in mice caused a tumor that's phenotypically indistinguishable form human Kaposi's sarcoma.[14] Activating or gain-of-function mutations of Rac1 are shown to play active roles in promoting mesenchymal-type of cell movement assisted by NEDD9 and DOCK3 protein complex.[15] Such abnormal cell motility may result in epithelial mesenchymal transition (EMT) – a driving mechanism for tumor metastasis as well as drug-resistant tumor relapse.[16][17]

Role in glucose transport [edit]

Rac1 is expressed in significant amounts in insulin sensitive tissues, such as adipose tissue and skeletal muscle. Here Rac1 regulated the translocation of glucose transporting GLUT4 vesicles from intracellular compartments to the plasma membrane.[9][18][19] In response to insulin, this allows for blood glucose to enter the cell to lower blood glucose. In conditions of obesity and type 2 diabetes, Rac1 signaling in skeletal muscle is dysfunctional, suggesting that Rac1 contributes to the progression of the disease. Rac1 protein is also necessary for glucose uptake in skeletal muscle activated by exercise[8][20] and muscle stretching[21]

Clinical significance [edit]

Activating mutations in Rac1 have been recently discovered in large-scale genomic studies involving melanoma [22][23][24] and non-small cell lung cancer.[25] As a result, Rac1 is considered a therapeutic target for many of these diseases.[26]

A few recent studies have also exploited targeted therapy to suppress tumor growth by pharmacological inhibition of Rac1 activity in metastatic melanoma and liver cancer as well as in human breast cancer.[27][28][29] For example, Rac1-dependent pathway inhibition resulted in the reversal of tumor cell phenotypes, suggesting Rac1 as a predictive marker and therapeutic target for trastuzumab-resistant breast cancer.[28] However, given Rac1's role in glucose transport, drugs that inhibits Rac1 could potentially be harmful to glucose homeostasis

Rac1 is a small (~21 kDa) signaling G protein (more specifically a GTPase), and is a member of the Rac subfamily of the family Rho family of GTPases. Members of this superfamily appear to regulate a diverse array of cellular events, including the control of GLUT4[8][9] translocation to glucose uptake, cell growth, cytoskeletal reorganization, antimicrobial cytotoxicity,[10] and the activation of protein kinases.[11]

Rac1 is a pleiotropic regulator of many cellular processes, including the cell cycle, cell-cell adhesion, motility (through the actin network), and of epithelial differentiation (proposed to be necessary for maintaining epidermal stem cells).

Role in cancer [edit]

Along with other subfamily of Rac and Rho proteins, they exert an important regulatory role specifically in cell motility and cell growth. Rac1 has ubiquitous tissue expression, and drives cell motility by formation of lamellipodia.[12] In order for cancer cells to grow and invade local and distant tissues, deregulation of cell motility is one of the hallmark events in cancer cell invasion and metastasis.[13] Overexpression of a constitutively active Rac1 V12 in mice caused a tumor that's phenotypically indistinguishable form human Kaposi's sarcoma.[14] Activating or gain-of-function mutations of Rac1 are shown to play active roles in promoting mesenchymal-type of cell movement assisted by NEDD9 and DOCK3 protein complex.[15] Such abnormal cell motility may result in epithelial mesenchymal transition (EMT) – a driving mechanism for tumor metastasis as well as drug-resistant tumor relapse.[16][17]

Role in glucose transport [edit]

Rac1 is expressed in significant amounts in insulin sensitive tissues, such as adipose tissue and skeletal muscle. Here Rac1 regulated the translocation of glucose transporting GLUT4 vesicles from intracellular compartments to the plasma membrane.[9][18][19] In response to insulin, this allows for blood glucose to enter the cell to lower blood glucose. In conditions of obesity and type 2 diabetes, Rac1 signaling in skeletal muscle is dysfunctional, suggesting that Rac1 contributes to the progression of the disease. Rac1 protein is also necessary for glucose uptake in skeletal muscle activated by exercise[8][20] and muscle stretching[21]

Clinical significance [edit]

Activating mutations in Rac1 have been recently discovered in large-scale genomic studies involving melanoma [22][23][24] and non-small cell lung cancer.[25] As a result, Rac1 is considered a therapeutic target for many of these diseases.[26]

A few recent studies have also exploited targeted therapy to suppress tumor growth by pharmacological inhibition of Rac1 activity in metastatic melanoma and liver cancer as well as in human breast cancer.[27][28][29] For example, Rac1-dependent pathway inhibition resulted in the reversal of tumor cell phenotypes, suggesting Rac1 as a predictive marker and therapeutic target for trastuzumab-resistant breast cancer.[28] However, given Rac1's role in glucose transport, drugs that inhibits Rac1 could potentially be harmful to glucose homeostasis

About: RAC1

An Entity of Type : Biomolecule, from Named Graph : http://dbpedia.org, within Data Space : dbpedia.org

Rac1, also known as Ras-related C3 botulinum toxin substrate 1, is a protein found in human cells. It is encoded by the RAC1 gene. This gene can produce a variety of alternatively spliced versions of the Rac1 protein, which appear to carry out different functions.

Property	Value
dbo:abstract	▪ Rac1 (RAS-related C3 botulinus toxin substrate 1) は、ヒト細胞に存在するタンパク質であり、RAC1遺伝子によりコードされている。RAC1は選択的スプライシングにより異なる機能を持ったいくつかのタンパク質を生成しており、このうちの1つがRac1である。Rac1は、悪性黒色腫や肺非小細胞癌 を含むさまざまな癌の発生において、重要な役割を果たしていると考えられている。そのため、現在これらの疾患に対する治療標的と考えられている。 (ja) ▪ Rac1 (англ. Ras-related C3 botulinum toxin substrate 1) — внутриклеточный белок из суперсемейства ГТФаз, относится к «малым» G-белкам. Находится в двух состояниях: активном ГТФ-связанном и неактивном ГДФ-связанном состоянии. В своей активной форме Rac1 связывается в клетке с целым рядом эффекторных белков и приводит к регулировке многих клеточных процессов, таких как секреция, фагоцитоз апоптозных клеток, поляризация эпителиальных клеток и индуцированное факторами роста образование мембранных складок и выростов (англ. membrane ruffles). RDF graphs

RDF to link data

RDF to link data

Definitions

(1) An RDF statement expresses a **relationship** between two resources

(2) The **subject** and the **object** represent the two resources being related ; the **predicate** represents the nature of their relationship

(3) The relationship is phrased in a **directional** way (from subject to object) and is called in RDF a **property**

(4) Because RDF statements consist of three elements they are called **triples**

RDF to link data

Definitions

(1) An RDF statement expresses a **relationship** between two resources

(2) The **subject** and the **object** represent the two resources being related ; the **predicate** represents the nature of their relationship

(3) The relationship is phrased in a **directional** way (from subject to object) and is called in RDF a **property**

(4) Because RDF statements consist of three elements they are called **triples**

Sample RDF triples :

```
<RAC1> <is a> <human gene> .
<seq1> <is a variant of> <RAC1> .
```

RDF graphs

RDF graphs

Definitions

(1) A **graph** structure is formed with a set of **nodes** (resources) and **edges**(relationships between resources)

(2) A set of RDF triples is called an RDF graph. RDF is a **directed**, **labeled graph** data format for representing information in the Web.

RDF graphs

Definitions

(1) A **graph** structure is formed with a set of **nodes** (resources) and **edges**(relationships between resources)

(2) A set of RDF triples is called an RDF graph. RDF is a **directed**, **labeled graph** data format for representing information in the Web.

RDF-S to represent knowledge graphs

RDF-Schema aims at providing a simple vocabulary to **organize domain-specific knowledge** through classes (**concepts**) and properties (**relationships**).

Classes

Resources may be divided into groups called **classes**. The members of a class are known as **instances** of the class. The rdf:**type** property may be used to state that a resource is an instance of a class (« is a » relation).

Properties

- rdfs:**range**: a constraint on the class membership(s) for values of this property
- rdfs:**domain**: a constraint on the class membership(s) for resources having this property
- rdfs:**label**, rdfs:**comment**
- rdf:**type**: to state that a resource is an instance of a class
- rdfs:**subClassOf**: to state that all the instances of one class are instances of another
- rdfs:**subPropertyOf**: to state that all resources related by one property are also related by another

Sample RDF-S vocabulary

https://www.ebi.ac.uk/rdf/documentation/biomodels/

Defining a domain-specific RDF property

```
my_ns:stoichiometry   rdf:type      rdfs:Property .
my_ns:stoichiometry   rdfs:domain   my_ns:SpeciesReference .
my_ns:stoichiometry   rdfs:range    xsd:double .
my_ns:stoichiometry   rdfs:label    "stoichiometry" .
```

Intuition for **logical inferences** (reasoning):

"Each thing designated by the stoichiometry property should be numerical value."

"*Each thing at the origin of a stoichiometry property should be a SpeciesReference object.*"

To go further: https://www.w3.org/TR/rdf11-mt/#rdf-entailment section 9.2.1

Querying and **Reasoning** on this Knowledge Graph

Queries with graph patterns

```
SELECT * WHERE {
  # Search variants
  ?subject ican:has_dna_sample ?sample .
  ?sample ican:is_heterozygotous ?variant .
  ?variant ican:has_chromosome "19" ;
           ican:has_position ?position ;
           ican:has_alt_allele ?alt_allele ;
           ican:has_ref_allele ?ref_allele .
  FILTER (?position > 10092337 && ?position < 10106407)
  # dbSNP identifier
  OPTIONAL { ?variant ican:has_dbsnp_id ?dbSNPid . }
  # First aneurysm rupture: age and localisation
  OPTIONAL { ?subject ican:age_first_rupture ?ageRupt . }
  OPTIONAL { ?subject ican:loc_first_rupture ?locRupt . }
}
```

Reasoning with ontologies

Quels sont les patients atteints de **HP:0002813 (“Abnormality of limb bone morphology”)** ?

	Subject	HPO term	Label
0	r18	HP_0010442	Polydactyly
1	r18	HP_0001830	Postaxial foot polydactyly
2	r18	HP_0200055	Small hand
3	r18	HP_0004209	Clinodactyly of the 5th finger
4	r18	HP_0001162	Postaxial hand polydactyly
5	r9	HP_0001162	Postaxial hand polydactyly
6	r9	HP_0010442	Polydactyly
7	r9	HP_0001830	Postaxial foot polydactyly
8	r11	HP_0001830	Postaxial foot polydactyly
9	r11	HP_0001162	Postaxial hand polydactyly
10	r11	HP_0010442	Polydactyly

Recap

Knowledge Graphs & Linked Data, **why ?**

- the gaps
- Something in the middle, between
- « Artificial intelligence » (knowledge representation, reasoning)
- Make sense out of data diversity ➞ better understand aneurysms

how ?

- **RDF** to represent statements (knowledge graphs)
- **Ontologies** as shared vocabularies / conceptuals models
  - **QIBO**: quantitative imaging biomarkers ontology
  - **Bioportal**: inter-linked life science ontologies

Next episode ?

- RDFization of your data (towards FAIRification)
- Hosting your data through a SPARQL endpoint
- Advanced SPARQL querying (property path expressions, nested queries, aggregates)
- Designing controlled vocabularies
- Designing formal ontologies
- Logical reasoning (Inference rules, RDFS entailments, OWL entailments)
- etc.

Web resources
